

Join a prostate cancer research trial

What is the Affirm Trial?

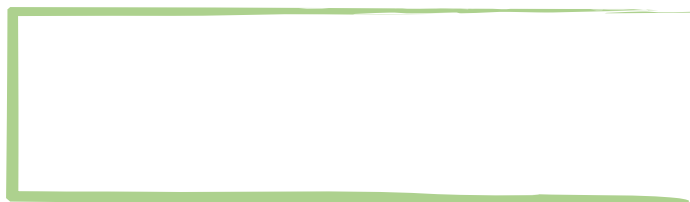

The Affirm Trial is a Phase 3 (late-stage) clinical research trial that will include about 1200 participants. The trial will test the effects of an oral investigational drug called MDV3100 in men with advanced prostate cancer that continues to progress despite treatment with chemotherapy and hormone therapy. The purpose of the Affirm Trial is to determine whether MDV3100 can safely slow the progression of the disease and extend the lives of men with prostate cancer.

Who can join the Affirm Trial?

Men who answer "yes" to the following questions may be able to join the Affirm Trial:

- 1 Do you have advanced prostate cancer?
- 2 Have you been treated with chemotherapy using docetaxel (Taxotere®)?
- 3 Has your prostate cancer progressed since your chemotherapy?
